

## Drive-In & Drive-Thru Pallet Rack

For high density storage of similar product, **NextLevel** Drive-In and Drive-Thru pallet racking allow you to store up to 80% more pallets than with selective racking.

### Drive-In Rack

Drive-In rack allows a lift truck to drive into the rack from one side to pick up or pull out pallets. The only limitation to the depth of storage is the size of the facility. Drive-In is a "last in, first out" (LIFO) method of storage. Drive-In is best when shelf life is not a major concern.

### Drive-Thru Rack

Drive Thru rack is similar to Drive-In but allows the lift truck to enter from either side to load or pick up pallets. Drive-Thru offers slightly less dense storage because it requires more aisles, but because Drive-Thru is open at both ends, it is a "first in, first out" (FIFO) method of storage--ideal for products with expiration dates.

### Applications

- Use to store many pallets of a similar product in a single pallet position.
- Use in cold storage applications to store as many pallets in as little expensive freezer space as possible.
- For storing items that move quickly out of inventory (Drive-In, LIFO)
- For storing items that are date sensitive (Drive Thru, FIFO)

### Benefits & Features

- High density
- Low cost
- Easy to install
- Space efficient
- Easy access to pallets
- Guaranteed stock rotation
- Can be used with standard handling equipment
- Available in roll formed or structural steel

*"If you can think it,  
we can make it."*
